Can Text Messages Sway More Black Parents to Vaccinate Teens for HPV? Rutgers Gets $600k Grant to Find Out

The U.S. Department of Health and Human Services is funding research at Rutgers University on how to increase uptake of Merck's human papillomavirus, or HPV, vaccine among Black adolescents, documents obtained by Children's Health Defense via a Freedom of Information Act request revealed.

By Brenda Baletti, Ph.D.

The U.S. Department of Health and Human Services (HHS) is funding research at Rutgers University on how to increase uptake of the human papillomavirus (HPV) vaccine among Black adolescents, documents obtained by Children's Health Defense (CHD) via a Freedom of Information Act (FOIA) request revealed.

HHS awarded the $600,000, three-year, grant, which will be administered by the National Cancer Institute (NCI), to Racquel Elizabeth Kohler, Ph.D.

It is one of nearly 50 grants identified by CHD in June — totaling more than $40 million — awarded by HHS to universities, healthcare systems and departments of public health to increase HPV vaccine uptake among adolescents.

The grant fits into a broader research program across HHS, including at the Centers for Disease Control and Prevention (CDC), to dedicate hundreds of millions of dollars toward creating "culturally tailored" strategies to increase vaccine uptake among "vaccine-hesitant" communities of color.

Kohler's research seeks to overcome vaccine "hesitancy" by developing text messages, or "tailored interventions," to send to Black families following an HPV vaccine recommendation by their provider.

The project hypothesizes that follow-up tailored text messages will increase vaccine confidence and motivate Black parents to vaccinate their children.

Kohler, who also is a co-investigator on a Merck grant to study "COVID-19 and vaccine confidence among underserved New Jersey communities," received the funding as part of NCI's Transition Career Development program, which helps develop skills for early career cancer researchers.

The approved grant proposal obtained by CHD notes that the study is a response to the Biden administration's Cancer Moonshot program that seeks to cut cancer deaths in half by 2047.

The National Institutes of Health developed the HPV vaccine technology, which it licensed exclusively to Merck — the only pharmaceutical company licensed to produce the HPV vaccine in the U.S.

More than 80 lawsuits against Merck are pending in federal court for vaccine injuries associated with its Gardasil HPV vaccine.

RFK Jr./Hooker NEW book: Vax-Unvax. Order Now!

Proposal builds on 'announcement approach' developed by Merck consultant

The proposal justifies the research based on the premise that black adolescents have the lowest rates of HPV vaccination relative to other racial and ethnic groups. But even the meta-analysis the application cites to support this claim said data supporting it are inconclusive.

And recent CDC data actually show Black adolescents have higher rates of HPV vaccination initiation and follow-through than white or Hispanic adolescents.

The proposal attributes the alleged low rates of HPV uptake to the problem of "vaccine hesitancy" among Black people, who have "low confidence in vaccine safety, low perceived HPV risk, lack of HPV knowledge, reliance on shared family decisions, high medical mistrust and racial discrimination experiences" that motivate their vaccination choices.

Other grant proposals analyzed by The Defender sought to develop and test the "announcement approach" as a primary method to overcome vaccine hesitancy.

In the "announcement approach," providers skip having an "open-ended conversation" with families about whether they want their child vaccinated for HPV. Instead, they "presume" the family wants the vaccine and "announce" that the child will receive it as if it were a routine part of the office visit.

This research says the announcement approach has more limited efficacy with Black families, many of whom remain hesitant despite recommendations by healthcare providers because of "cultural beliefs" about vaccination and lower levels of trust in authorities than other racial or ethnic groups.

These claims match a large body of research on "vaccine hesitancy" among people of color that cites such "beliefs" that ought to be changed, instead of acknowledging that some people reject the vaccines on the basis of informed decision-making.

According to Kohler's proposal, Black families that may not be responsive to the announcement approach alone are instead responsive to supplementary forms of communication — longer conversations with more information — and further interventions that follow provider recommendations in the office visit.

The grant implements a pilot study to develop text messages tailored to overcome "vaccine hesitancy" among Black families and aims to create a text intervention that can later be tested in a larger, definitive clinical trial.

Researchers will draft a bank of sample messages based on common concerns found to be held by Black "vaccine-hesitant" parents. Through focus groups with parents, researchers will identify the best prototype messages.

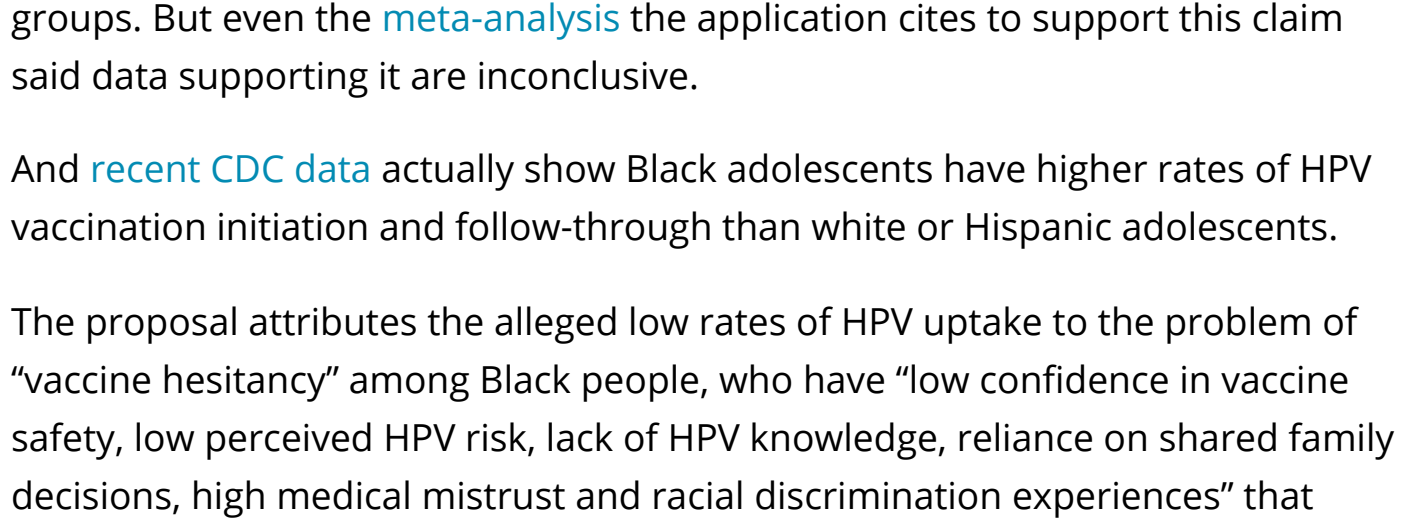
Parents will receive $50 for participating in the focus groups.

Next, researchers will conduct a randomized controlled trial comparing individually tailored interventions for Blacks against the untailored ones, collecting responses through online surveys for which parents will be compensated $25.

Follow-up interviews with parents will inform researchers' understanding of which messages and supplemental resources were the most culturally appropriate, relevant and useful.

The researchers developed the intervention based on the "Increasing Vaccination" model, a psychological approach to increasing vaccine uptake that focuses on developing strategies for changing people's thoughts and feelings to get them to take more vaccines.

This approach, like the announcement approach, was developed by Noel Brewer, the Merck Consultant and University of North Carolina behavioral psychologist who received millions in grant funding from the CDC, The Defender reported.



Your support helps fund this work, and CHD's related advocacy, education, and scientific research.

No proof HPV vaccines prevent cervical cancer

Kohler's proposal cites 2014 CDC data showing Black women have the highest prevalence of HPV infection in the U.S., and a higher incidence and mortality rate of cervical cancer than white women.

But experts told The Defender there's no proof that HPV vaccines reduce the risk of cervical cancer.

Studying HPV vaccine efficacy for eliminating cervical cancer is challenging due to the extended time — 23.5 years on average — between infection and the development of cancer, lack of adequate informed consent and the complex relationship between HPV infection and cervical cancer.

Vaccinated women, believing they are protected, may also engage in riskier behavior and therefore worsen the risk of cervical cancer.

According to James Lyons-Weiler, Ph.D., president and CEO of the Institute for Pure and Applied Knowledge, studies claiming the vaccine reduces cervical cancer are misleading for a number of reasons.

For example, some research has shown that because the HPV vaccine targets only specific HPV strains, it has led to an increase in more lethal types of HPV, replacing the less lethal types targeted by vaccination.

Lyons also pointed to other research, published in the Journal of the Royal Society of Medicine, showing that Phase 2 and Phase 3 efficacy trials themselves have been rife with methodological problems that undermine efficacy claims.

That research also points out that none of the trials were designed to detect the vaccine's effectiveness against cervical cancer. And most trials tested HPV outcomes for people much older than children ages 9-13, when vaccination is typically offered.

Research shows that in all countries that performed smear screening, the pre-vaccination period from 1989 to 2007 was marked by a significant decrease in the incidence of cervical cancer. And that since vaccination began, that trend has reversed.

Also, despite Merck's marketing of the HPV vaccine as "safe and effective," many recipients have experienced serious side effects.

Some of the signature impacts observed following HPV vaccination include permanently disabling autoimmune and neurological conditions such as postural orthostatic tachycardia syndrome, or POTS, fibromyalgia and myalgic encephalomyelitis/chronic fatigue syndrome.

There have been thousands of reports of adverse events worldwide, peer-reviewed scientific literature from the U.S., Australia, Denmark, Sweden, France and Japan, and statistics published by public health agencies in each of these countries that demonstrate associations between HPV vaccination and autoimmune conditions.

HPV vaccine is one of the most deadly of the vaccine horror show. Should be removed from the market, period
21 0 Reply • Share ›

Good Ole Mitch → donegoing2002
5 days ago
They're pushing the HPV Vaccines hard right now, so the harm(s) typically caused by these neuro-toxic shots, will be masked by the ongoing fall-out of the ongoing Gene Therapy Clinical World Trial. (essentially a massive gain of function experiment & they're not done, folks....lol!)
As a layman, the side-effects of the HPV folks can look clinically indistinguishable from Gene Therapy Therapeutics i.e. POTS, Anaphylaxis, Auto-Immune Diseases, etc.

Hopefully this will all backfire and make people less likely to take any vaccine. I would like to know though. why HHS is paying 600 thousand dollars to market a vaccine that is known to be dangerous? Shouldn't the vaccine manufacture be paying this? Oh I forgot. Big pharma runs the government.

Actually the central banks don't run the government, they are the government. And the BIS in the Tower of Basle coordinated their efforts. The entire clotshot atrocity was rolled out, stem to stern by the Department of "Defense." Big Pharma was actually just paid actors. Do exactly what we tell you and you will make an unimaginable amount of money. DoD bought all the fake vaccines under traditional weapons contracts. Since the fake vaxes were bought under contracts that just called the "countermeasures" like Patriot missiles, the CDC and the FDA had no regulatory power over their distribution to the unknowing public. This sounds like a nutcase fantasy, but it has all been thoroughly documented under released FOIA requests. Use a search engine to find Katherine Watt. They are so confident that they are untouchable, that they enjoy flaunting it in our faces.

Why does the gov give money for "research" unless it's for behavioral therapy. Perhaps the clandestine psyops never ceased, they simply changed the term thereby cloaking their true MO. The unsuspected or captured mind is easily manipulated thus succumbing to gov control. Are they playing with the Tuskegee men again?

Why use text messages when their medical school can offer free lobotomies? Pull a couple of MD's off the Remdesivir death squad. Maybe get Army medics to do them like with the clotshot. But one would first need to submit a DNA test sample to see if you're sufficiently "black" in order to get your free lobotomy.

It is becoming obvious to me that 95% of our politicians are either bought off or blackmailed. Their do nothing stance on everything, while grandstanding and talking endlessly, PRETENDING to take a criminal to task, is something that we cannot allow to go on.(The Rand Paul - Fauci crap, is just one example that has gone on for how long now?) When you realize that the Pharmaceutical Lobby controls our Government and most Govt's around the planet, there is only one thing that can be done, MAJOR CONTINUOUS EXPOSE`s, AFTER USING COUNTER-BLACK MAIL ON OUR OWN LEGISLATORS! We have all the same dirt on them that the other side has, so why don't we use it?

I'm from Canada but I'm going to share my story about the HPV vaccine. My daughter when she was in highschool, grade 8 or 9, (I honestly can't remember which), came home from school with the form to get the HPV vaccine - she was to get one shot that week and the 2nd follow-up shot in a few months . Since I knew nothing about the vaccine, I did some research, both online as well as at our Doctor's office. My doctor as well as his receptionist both said that they chose NOT to give their daughters the shot and the reasons why. So I ticked the NO box, signed the form and sent it back to school with her and thought nothing more of it. So fast forward a couple of months and my daughter comes home from school with the form for her 2nd HPV shot. I asked her what the heck for because I had declined the first shot!! My daughter started crying and told me that on the day of the shot when all the girls were lined up to get the vaccine she was standing with her friends who's parents had chosen to get their shots. The nurses asked her why she was not getting it and that it was so important. They told her about all these dangers of NOT getting the shot and that she could get cervical cancer and die. They also told her that she had the right to cross out my signature and sign for herself. They bullied and frightened my daughter into crossing out my signature and signing for herself getting the shot. I was so angry! I went to the school who told me I'd have to get a hold of the nurses at the health clinic who were giving out the shots. When I called them they were angry at me for refusing to get the shot for my daughter and basically told me that I was unfit to parent. They said that at the age of 13 -14 she had the right not make her own decisions. So basically they said that they had the right to make medical decisions for my daughter. I was beyond angry. I was going to go to the newspapers but my daughter begged me not to. She said she didn't want to make a big fuss and be bullied at school. I was beyond angry as a parent that the government health unit thought they had the right to make medical decisions for my child, but there was really nothing I could do.

I'm very sorry this happened. How difficult it must be to be a parent these days.They probably were paid for every shot they administered. I wonder how many kids were in the same situation only did not tell their parents they were injected anyway or if they did, what could their parents do about it? This is quite unbelievable, a gross disregard of parents rights and the child's immediate and long term health and for what, $50 per shot? And in schools, institutions we trust to educate and care for children. Disgusting if not outright criminal.

This is a sad story. I think in some states in this country, you'd be able to take them to court but Canada seems more authoritarian. The HPV shot protects the recipient from nothing. No HPV has been isolated. Another fairy tale to sell snake oil. Using bullying and peer pressure to submit to a medical treatment(a very dangerous one) is what you expect from communist China, not a supposed free country.

Rutgers is one of the colleges that is still requiring that students be injected with the clot shots, depite clear evidence it has zero benefits and causes harm. Rutgers apparently bought and owned by pharma. It would be best that all students look for better places of education. What they are doing now is no different from the Tuskegee experiments.

I went looking on Medscape, the doctors' clinical news site and found this https://www.medscape.com/s/... about how family doctors make a few dollars less than pediatricians do for administering this series of shots, and how they should be started when girls are only NINE rather than eleven. Clearly those few dollars affect clinical efforts on behalf of Big Pharma.
So why not let AI do some of coercion of the parents? It's only deeply cynical and craven, and built upon the assumption that they can push the emotional buttons of parents until they feel an overwhelming desire to lay their kids upon the altar of conformity.

Black adolescents have the lowest rates of HPV vaccination relative to other racial and ethnic groups because they have been gifted with a healthy skepticism of the intentions of "the man". Good for them.
2 0 Reply • Share ›

Dana Wilkes
6 days ago
If the vaccine last only 5 to 7 years at most! Then you would need booster vaccine shots every so many years. Go back to smear screening, and be safe. Hearing or reading that "safe and effective" mantra is sickening.
2 0 Reply • Share ›

lakewoodsteve → Dana Wilkes
4 days ago
"Safe and effective" as old B.J. Bill would say, "It all depends on what your definition of safe & effective, is, is. I.E. Effective in making money, & making more people sick & in need for more medications ! i.e. Safe because no 5 billion in fruad fines executive has ever been imprisoned for the deaths their billions in fruad caused!

Suzanne Renard
6 days ago
Thank you for exposing this treachery. I can't find any other word for it.

The hubris of this "nudging"--supposedly in a culturally "sensitive" way--is unbelievably grotesque. Likewise inhuman is the doctor's "announcement" that a child will be given a shot, dispensing with even the pretense of "safe, effective, and necessary" which has long masqueraded as informed consent.

Rather than protecting our children from these predatory medical practices, our government agencies are spending our money to study ways to manipulate and trick us into violating our own better judgement and intuition regarding our care of our beloved children. What could be more shameful?

We must hope that parents will see through their patronizing project, and that their effort will fail spectacularly. "Hesitancy" in our world now is a form of high intelligence and taking responsibility for our choices.

This observation is beautiful: "These claims match a large body of research on "vaccine hesitancy" among people of color that cites such "beliefs" that ought to be changed, instead of acknowledging that some people reject the vaccines on the basis of informed decision-making."

So...50 bucks to be in a focus group. 25 bucks for filling in a survey. How much for a child is injured or killed by this shot? How much for the grieving family? To those who would treat other people in such a condescending way, I hope you get schooled by the people you are targeting with your twisted scheme!

Clare Goldsberry
6 days ago
Let's hope that Black people remember the Tuskegee experiment and never participate in another experiment again. While HPV has been approved, its adverse events are terrible -- sterility, and even found to cause cancer (which it is supposed to prevent -- new study out on that), and now they're pushing it on boys!! People need to be aware that there is a lawsuit ongoing on this drug. It's obvious that Big Harma doesn't care who it kills or maims, they just want to sell drugs. I did see another recent report however that people are becoming HPV hesitant. We can only hope. I think the C-19 vax horrors has really taught people the dangers of all these "vaccines."

Look at history right up until the present. First women were property [still are in some countries] who could not own land or vote. We were only allowed careers after the war machine learned they could double output and increase tax revenue. The big freedom we were given when birth control pills came out never told us any of the real risks; same with the morning after pill and the abortion pill. HPV,H1N1 and Covid shots have been a disaster for women and babies at alarming rates. Now the icing on the cake is we have to compete in sports for scholarships against mentally ill men who claim to be women and can no longer be safe in our locker rooms, bathrooms, and even prisons from this evil IDEOLOGY [not biology] created by Dr John Money who butchered and molested a twin boy whose penis was destroyed during a circumcision by telling the parents he could be operated on and raised as a girl. When he found out what they had done to him the boy/girl killed himself ; yet Dr. Money[from Johns Hopkins] declared the "experiment" [with ONE child} proof that it was successful and wrote books & lectured around the country creating this religion of gender transitioning. No they don't care about or protect women. The globalist cabal is working on an artificial uterus and sex robots so they can eliminate us altogether.

I suppose it is just a coincidence that Rutgers has also joined in with the "let's start masking" party again. As far as the black population goes, they have been used and abused in the past by our medical system. I don't think a text message is going to do it.

What the H is this from illegals or another Xovid complication, or 1 they can use to enforce more masks/lockdowns?

Five deaths in Virginia connected to statewide meningococcal disease outbreak

Five people have died from complications of a “rare but serious illness” in Virginia following a statewide outbreak of meningococcal disease, the Virginia Department of Health announced.

Twenty-seven cases of the disease, caused by the bacteria Neisseria meningitidis type Y, have been reported in eastern, central, and southwest Virginia since June 2022, according to the department.

Most case-patients are Black or African American adults between 30 to 60 years of age, according to the Virginia Health Department. Only one person was vaccinated for Neisseria meningitidis type Y out of the 27 reported cases.

The more poisoned the population, the more profitable it is to the drug industry...the sicker everyone is the more medicine they will need...poorly tested drugs with nasty side effects (and I know what I'm talking about, my family has suffered!) causing more illness for which one will need more medicine...A wonderfully lucrative merry-go-round.

The newly released book "Vax-Unvax" is a crucial resource on comparing the vaccinated to those who refrained from getting the shots. Most of the studies are on the "traditional" (childhood, flu)injections, but there are some with the recent C19 variety. The pharmaceutical corporations have closed the loop with their cause/remedy tactic that
many follow.
